首先创建一个Maven的web项目(该处不介绍)。

配置pom. xm1

```
properties>
        <java.version>1.8</java.version>
    </properties>
    <!-- 从Spring Boot继承默认配置 -->
 <parent>
    <groupId>org.springframework.boot</groupId>
    <artifactId>spring-boot-starter-parent</artifactId>
    <version>1.5.4.RELEASE</version>
 </parent>
    <dependencies>
        <dependency>
             <groupId>org.springframework.boot</groupId>
             <artifactId>spring-boot-starter-web</artifactId>
        </dependency>
    </dependencies>
    <build>
        <finalName>springBootDemo</finalName>
        <!-- 打包成可执行jar文件 -->
        <plugins>
             <plugin>
                 <groupId>org.springframework.boot</groupId>
                 <artifactId>spring-boot-maven-plugin</artifactId>
             </plugin>
        </plugins>
    </build>
```

编写启动类 (注意点看注释)

```
@Controller
public class DemoController {
    @RequestMapping("/boot/demo")
    public @ResponseBody String demo() {
        return "Hello Spring boot";
}
```

运行后结果

Hello Spring boot
